

## Descriptive - Statistic - 1(A).

### Very short Question.

- ① (a) Define Statistics and <sup>state</sup> briefly its primary objects.
- ② Differentiate between ordinal and nominal data.
- ③ Name two advantages of presenting data in a tabular format.
- ④ Define statistical population.
- ⑤ What do you mean by statistical data.
- ⑥ Name the different parts of table in connection with tabulation of data.
- ⑦ Distinguish between nominal and ordinal data with examples.
- ⑧ Name two different diagrams used in representing attribute. [ER-Diagram, class-Diagram]
- (i) Give examples of Discrete variable and Continuous variable.

### Short/Long Questions:-

1. Interpret the stem-and-leaf plot provided below which represents the test scores of the students in a class.

| Stem | Leaf             |
|------|------------------|
| 2    | 1, 4             |
| 3    | 0, 2, 4, 5, 6    |
| 4    | 0, 2, 3, 4, 5, 7 |

2. A researcher collected data on the heights (in inches) of 50 individuals.

The data is as follows.

{ 64, 67, 70, 68, 65, 63, 71, 69, 72, 66,  
68, 64, 70, 67, 69, 65, 71, 68, 66, 63,  
70, 67, 69, 65, 68, 64, 71, 69, 67, 69,  
66, 63, 70, 68, 72, 67, 69, 65, 63, 71,  
68, 66, 64, 70, 67, 69, 66, 63, 70, 78 }

Construct frequency distribution table for this data taking at least five class intervals and determine the mode.

3. Explain with examples, frequency type and non-frequency type data. What is meant by median of the distribution. How do you obtain the median for a grouped data? If a variable  $x$  has median 'm' what will be the median of the variable  $y = e^x$ .
4. Define Histogram and describe how it is constructed. Mention one use of it.

⑤ ② Distinguish with examples, between Frequency and Non-frequency type of data

⑥ Describe the situation where Pie-chart is used. Also describe the method of pie-chart

⑦ Describe the steps of construction of frequency distribution of a continuous variable.
